

# Cell Broadcast System Factsheet

## Infocast

Infocast makes it possible to set up simple information services like news headlines, latest financial information, weather forecasts, etc. without programming effort. The text information can be located in a file, a web page, or any other information store.

For simple automatic services a framework has been made available that can be used to set up quickly new Cell Broadcast services. With this framework, named Infocast, it's easy to define an SMS-CB message service that retrieves its information from a dynamic source. The

message text can be located in a file, a web page, or any other information source.

Infocast is currently available for HP Tru64 Unix, and shortly on Linux and can be installed on the CBC node, or on a system that connects to the CBC.

The message text is retrieved from a dynamic source like the Internet, and message parameters are defined in a configuration file.

Service examples are provided in the manual.
